# Test Plan – Aurazone E-commerce Website

## 1. Introduction

This test plan describes the testing approach for the website:

https://test.aurazone.shop/.

The goal is to ensure that the application works correctly, is user-friendly, and free from major defects.

## 2.Scope of Testing

- User Registration & Login.
- Product Listing & Product Details.
- Add to Cart / Remove from Cart.
- Checkoutprocess.
- UI/UX and responsiveness.

**Out of Scope:**

- Payment gateway real transactions
- Backend/database validation (no access).

## 3.Features to be Tested

- Navigation (menus, links).
- Search functionality (if available).
- Product selection.
- Cart functionality.
- Form validations (login/signup).
- Buttons and links behaviour.

## 4.Types of Testing

- Functional Testing → Verify features work correctly.
- UI Testing → Check layout, alignment, design.
- Usability Testing → Ease of use for users.

- Cross-Browser Testing → Chrome, Edge/Firefox.
- Responsive Testing → Mobile and tablet views.

**5. Test Environment**

- OS: Windows / Android.
- Browsers: Chrome, Edge, Mobile Chrome.
- Internet connection required.

## 6. Assumptions

- Website is in testing environment.
- Users have valid internet connection.
- No heavy traffic or server issues.

## 7. Entry Criteria

- Website URL is accessible.
- Application is up and running.

## 8. Exit Criteria

- All major functionalities tested.
- At least 5 defects identified and documented.
- Test scenarios executed successfully.

## 9. Risks

- Server downtime.
- Incomplete features.
- Limited access to backend data.

**10. Deliverables**

- Test Plan document.
- Bug Report with screenshots.
- Cross-browser testing results,Automation scripts (GitHub link).

**11. Test Approach**

- Testing will be performed using exploratory testing techniques.
- Key user flows such as login, product selection, and checkout will be prioritized.
- Both positive and negative scenarios will be validated.

# CROSS-PLATFORM TESTING

**Define Platforms**

Test the site on:

**1.Desktop browsers**: Chrome, Firefox, Edge, Safari.

**2.Mobile views**: Chrome (Android), Safari (iOS), or responsive mode in dev tools.

## 2. Prepare Test Scenarios

Run the same core flows on each platform:

- Homepage loads correctly.
- Product listing displays properly.
- Filters (color, size, category, price).
- Wishlist (heart icon).
- Cart (add/remove items).
- Pagination (Next/Previous buttons).
- Checkout flow (if available).

**4. Capture Evidence**

- Take screenshots of issues.
- Label them by platform (e.g., “Chrome Desktop – Add to Cart delayed”).

**5. Document Findings**

Create a comparison table in your report:

| Browser/Device | Observed Issues. |
|---|---|
| Chrome (Desktop) | Add to Cart delayed response. |
| Firefox (Desktop) | Wishlist not updating. |
| Edge (Desktop) | Pagination button unresponsive. |
| Safari (Desktop) | Layout shifts on product cards. |
| Chrome (Mobile) | Text overlaps in product listing. |
| Safari (Mobile) | Cart icon misaligned. |

## 6. Summarize

- Highlight consistent bugs (appear across all browsers).
- Highlight browser-specific bugs (only in one).
- Mention mobile responsiveness issues separately.

# QA THINKING

**QA Thinking :** When evaluating the AuraZone website, several high-risk areas stand out:

**Checkout & Payment Flow:** This is the most critical part of any e-commerce site. If checkout fails or payments don't process correctly, it directly impacts revenue and user trust.

**Cart Functionality:** Adding/removing items must be reliable. Any delay or failure here frustrates users and can cause abandonment.

**Filters & Search:** Product discovery depends heavily on filters. Bugs like restrictive conditions or empty categories (e.g., Kids filter) prevent users from finding items.

**Wishlist & User Engagement Features:** While secondary to checkout, wishlist functionality is important for customer retention and repeat visits.

**Cross-Platform Responsiveness:** Layout issues on mobile or browser-specific failures can block a large segment of users.

Prioritization if Given More Time

First, I would prioritize checkout and cart testing (functional + edge cases).

Next, I'd focus on filter/search accuracy since it drives product visibility.

Finally, I'd expand into performance testing (page load times, image optimization) and security testing (input validation, session handling).
